eMedApps Immunization Solution for State Reporting

Reduce errors and prevent potential vaccination duplication

You and your staff are busy! Automate your immunization reporting, keep your patient immunization records up-to-date and complete, and safeguard against the potential for human error with this new immunization reporting tool.

AUTOMATED STATE REGISTRY QUERY

Our Immuniztion Solution for State Reporting tool automates this critical reporting function.

- Reduce invalid data by getting the patient immunization history from the State versus from a parent's or patient's recall.
- The tool enables clinicians to query a set timeframe ahead of the encounter to ensure charts are updated prior to seeing the patient.

AUTOMATIC UPDATES

Update the State automatically with information entered into the patient record. This not only reduces the potential for error, but also frees your staff from repeating data entry. Our solution includes two separate interfaces:

- One interface allows users to upload unsolicited vaccines to the state in which they are located.
- The other interface queries that state for immunizations for particular patients.

Combined they reduce possible errors and prevent potential duplication of vaccinations for patients.
